How to determine results using Multi-Disability Standards (MDS) for Track Events

Competitors compete against a multi-disability standard time for their classification.

Place's are determined by the competitor's time calculated against a percentage of the multi-disability standard for that classification.

Competitors are then ranked from highest to lowest percentage to determine places.

Example for 100 metres -

Boy competitor with classification of T20 has a performance is 16.52 sec

Percentage for determining results is T20 Classification MDS (from table above 11.90) divided by competitors performance times 100

or $(11.90/16.52) \times 100 = 72.03\%$

Please Note: Times in excess of 1 minute may need to be converted to equivalent seconds for ease of determine percentage.

How to determine results using Multi-Disability Standards (MDS) for Field Events

Competitors compete against a multi-disability standard height/distance for their classification.

Place's are determined by the competitor's height/distance calculated against a percentage of the multi-disability standard for that classification.

Competitors are then ranked from highest to lowest percentage to determine places.

Example for discus -

Girl Competitor with classification of F55 has a performances of 14.96 metres

Percentage for determining results is competitors performance divided by F55 Classification MDS (from table above 17.94) times 100

or $(14.96/17.94) \times 100 = 83.38\%$
